

Model Validation (MOD 26/27) for Renewable Systems Using MATLAB and Simulink

Agenda

- Introduction to Model Validation
- Building Renewable Energy Models in Simulink
- MOD 26/27 Validation Studies

Reality vs. models (WSCC August 10, 1996)

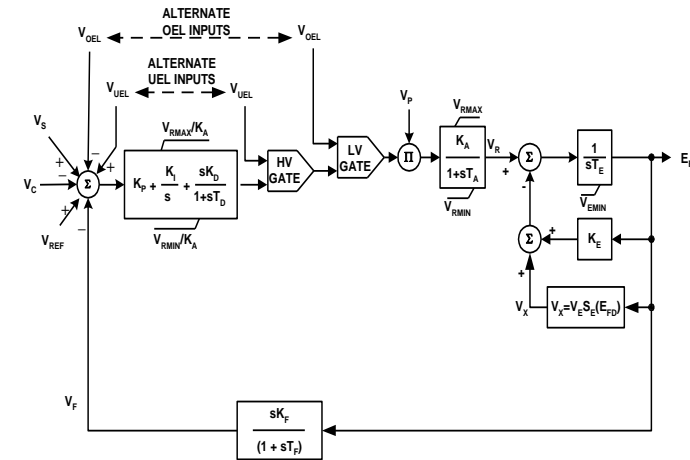

What is Model Validation?

Renewables Field Equipment

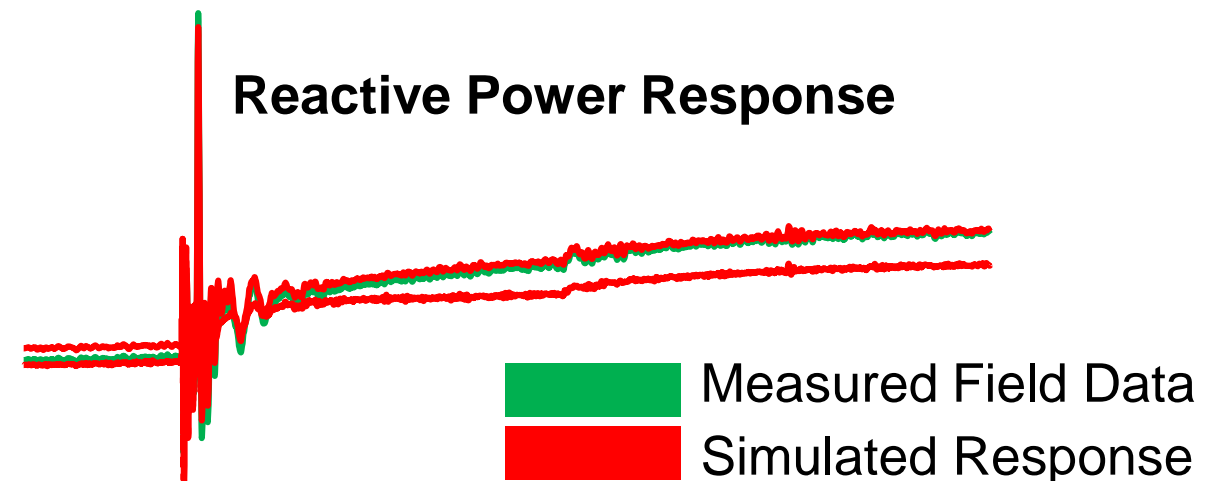

Standardized Models of Equipment

Active Power Response

Reactive Power Response

NERCNORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION**MATLAB® and Simulink®**

The MATLAB and Simulink product family from MathWorks provides tools that support automation and scaling of power system model verification tasks. Visit this [link](#) to access on-line tutorials. Workflows for model verification that use both offline generator testing and online performance monitoring are established through the following capabilities,

1. Access data from data historians, field instruments, SQL databases, text files, binary files and other APIs.
2. Model the system using standard representations of generation equipment and/or build your own from base components.
3. Replay offline or online data from digital fault recorders and/or PMUs through the simulation model.
4. Estimate model parameters of generation and control equipment using formal optimization techniques.
5. Scale the model verification task for multiple generation assets through automated scripting.
6. Continuously verify models by including new events and historical events in the model verification task.
7. Share the outcome of the model verification task through automated reporting and transfer of parameter values to other simulation platforms.

Reliability Guideline

Power Plant Dynamic Model Verification
using PMUs

Agenda

- Introduction to Model Validation
- Building Renewable Energy Models in Simulink
- MOD 26/27 Validation Studies

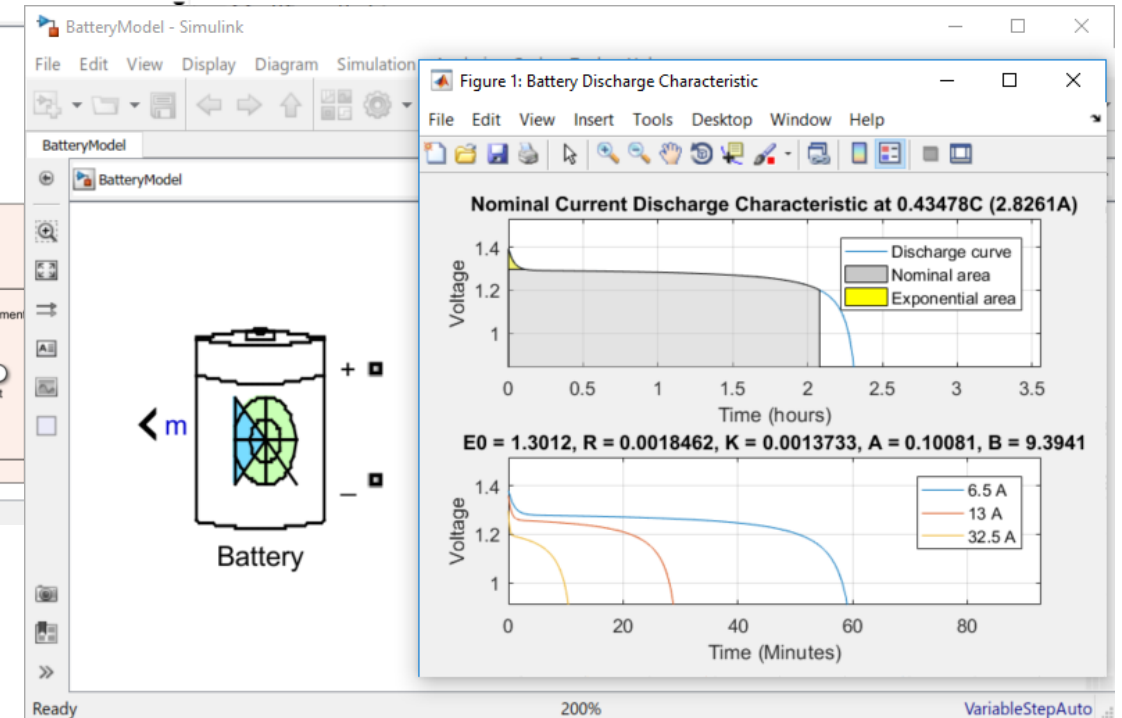

Model Using Fundamental Approaches

**First Principles
Simulink**

**Physical Components
Simscape**

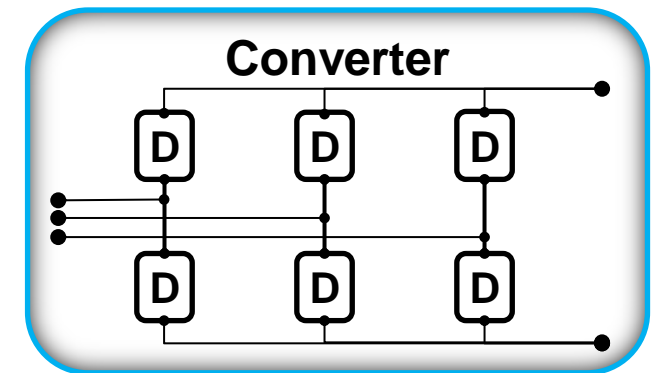

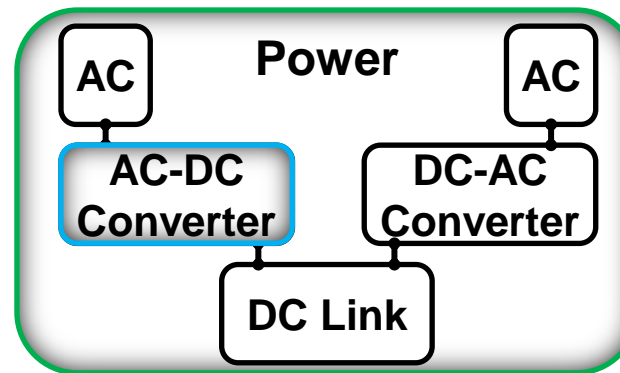

**Complete Components
Simscape Electrical**

Simscape Electrical Simulation Modes

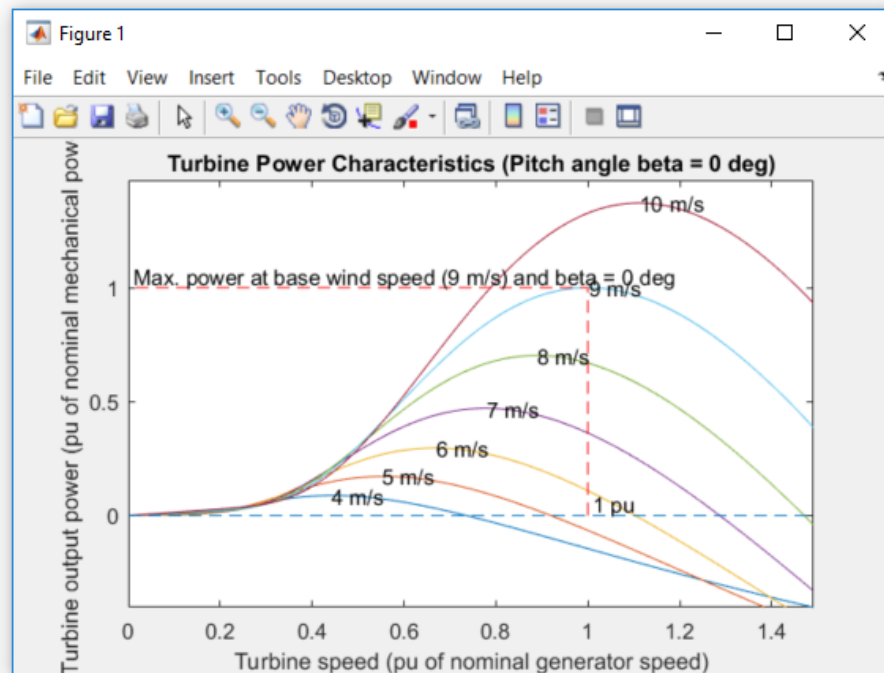

Different Fidelities for Different Tasks

	System-Level Behavior	Component Validation	Component Design
Electrical	Determine power requirements Evaluate system-level response Measure efficiency	Stay within design envelope Effect of switching dynamics	Losses during switching events Analyze & predict fault behavior

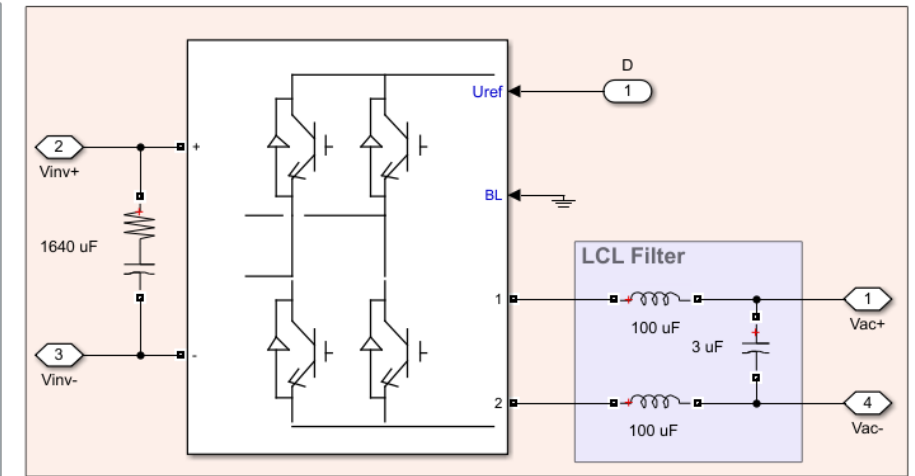

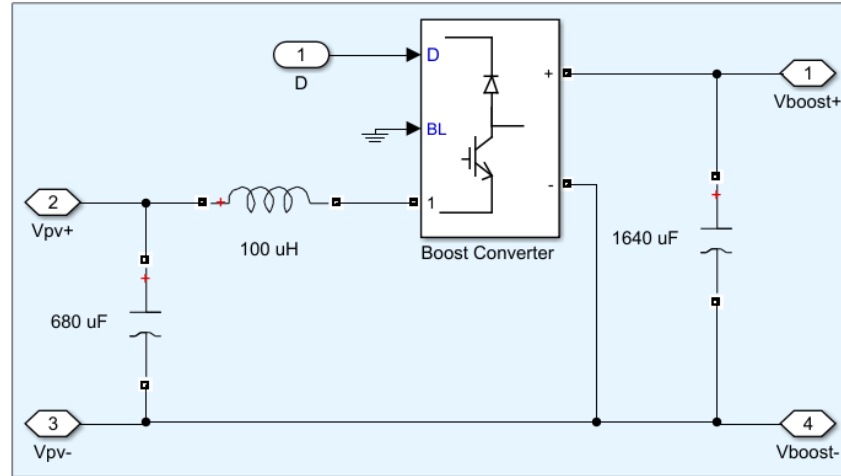

Built-in Renewable Energy Models with Simscape Electrical

Wind, Solar, Energy Storage, etc.

Example Solar Inverter Simulation – For Equipment Design

Inverter Designers Leverage Proprietary Control

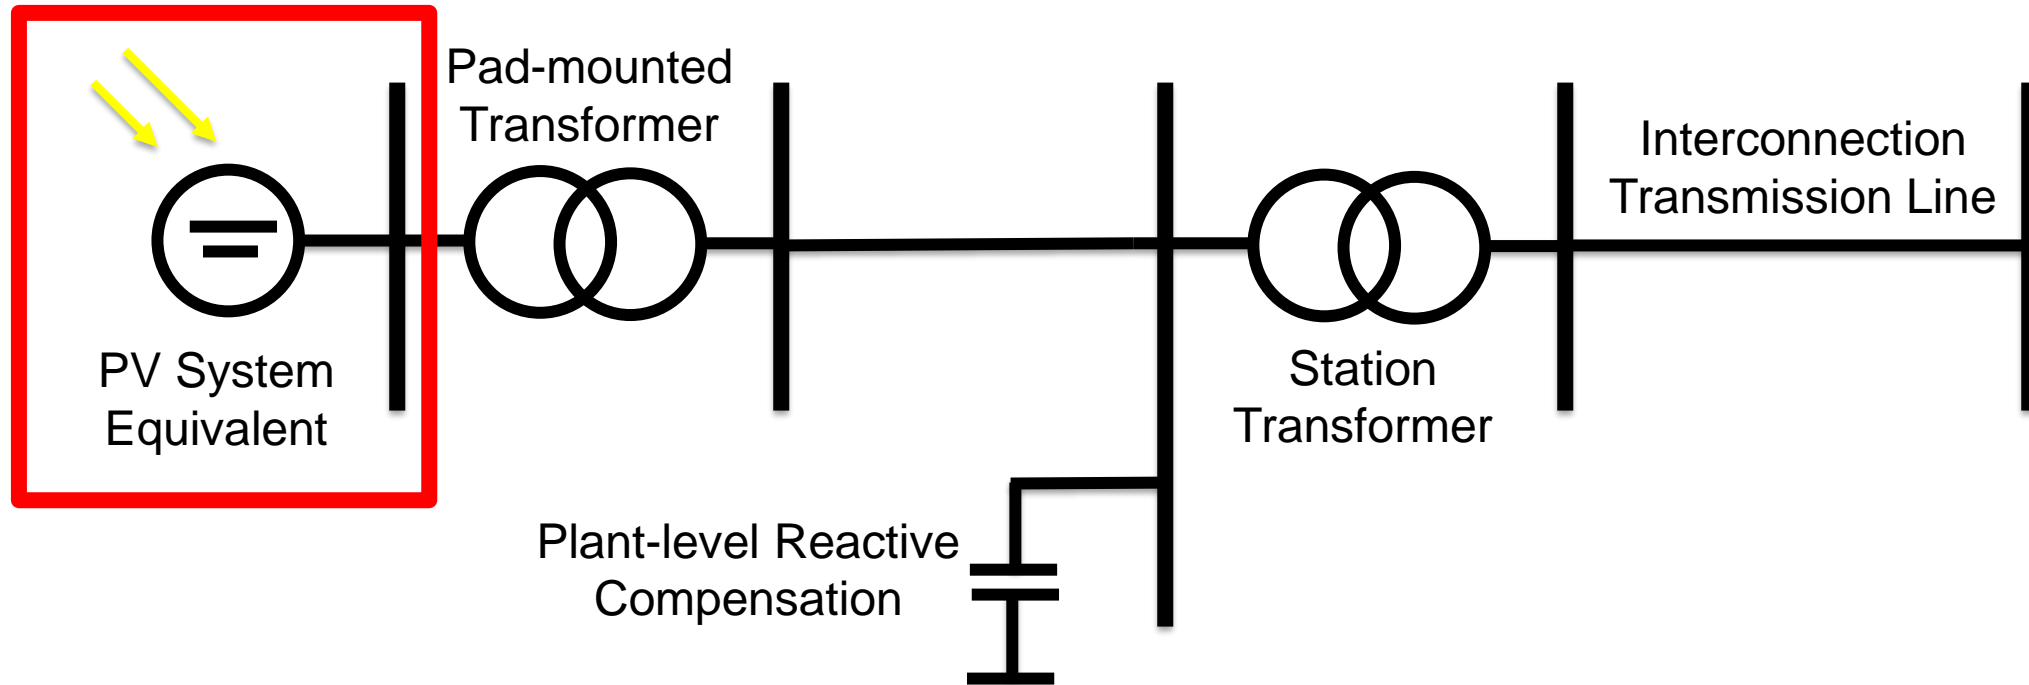

Agenda

- Introduction to Model Validation
- Building Renewable Energy Models in Simulink
- MOD 26/27 Validation Studies

Central Station Solar Plant One-line Diagram and Controls

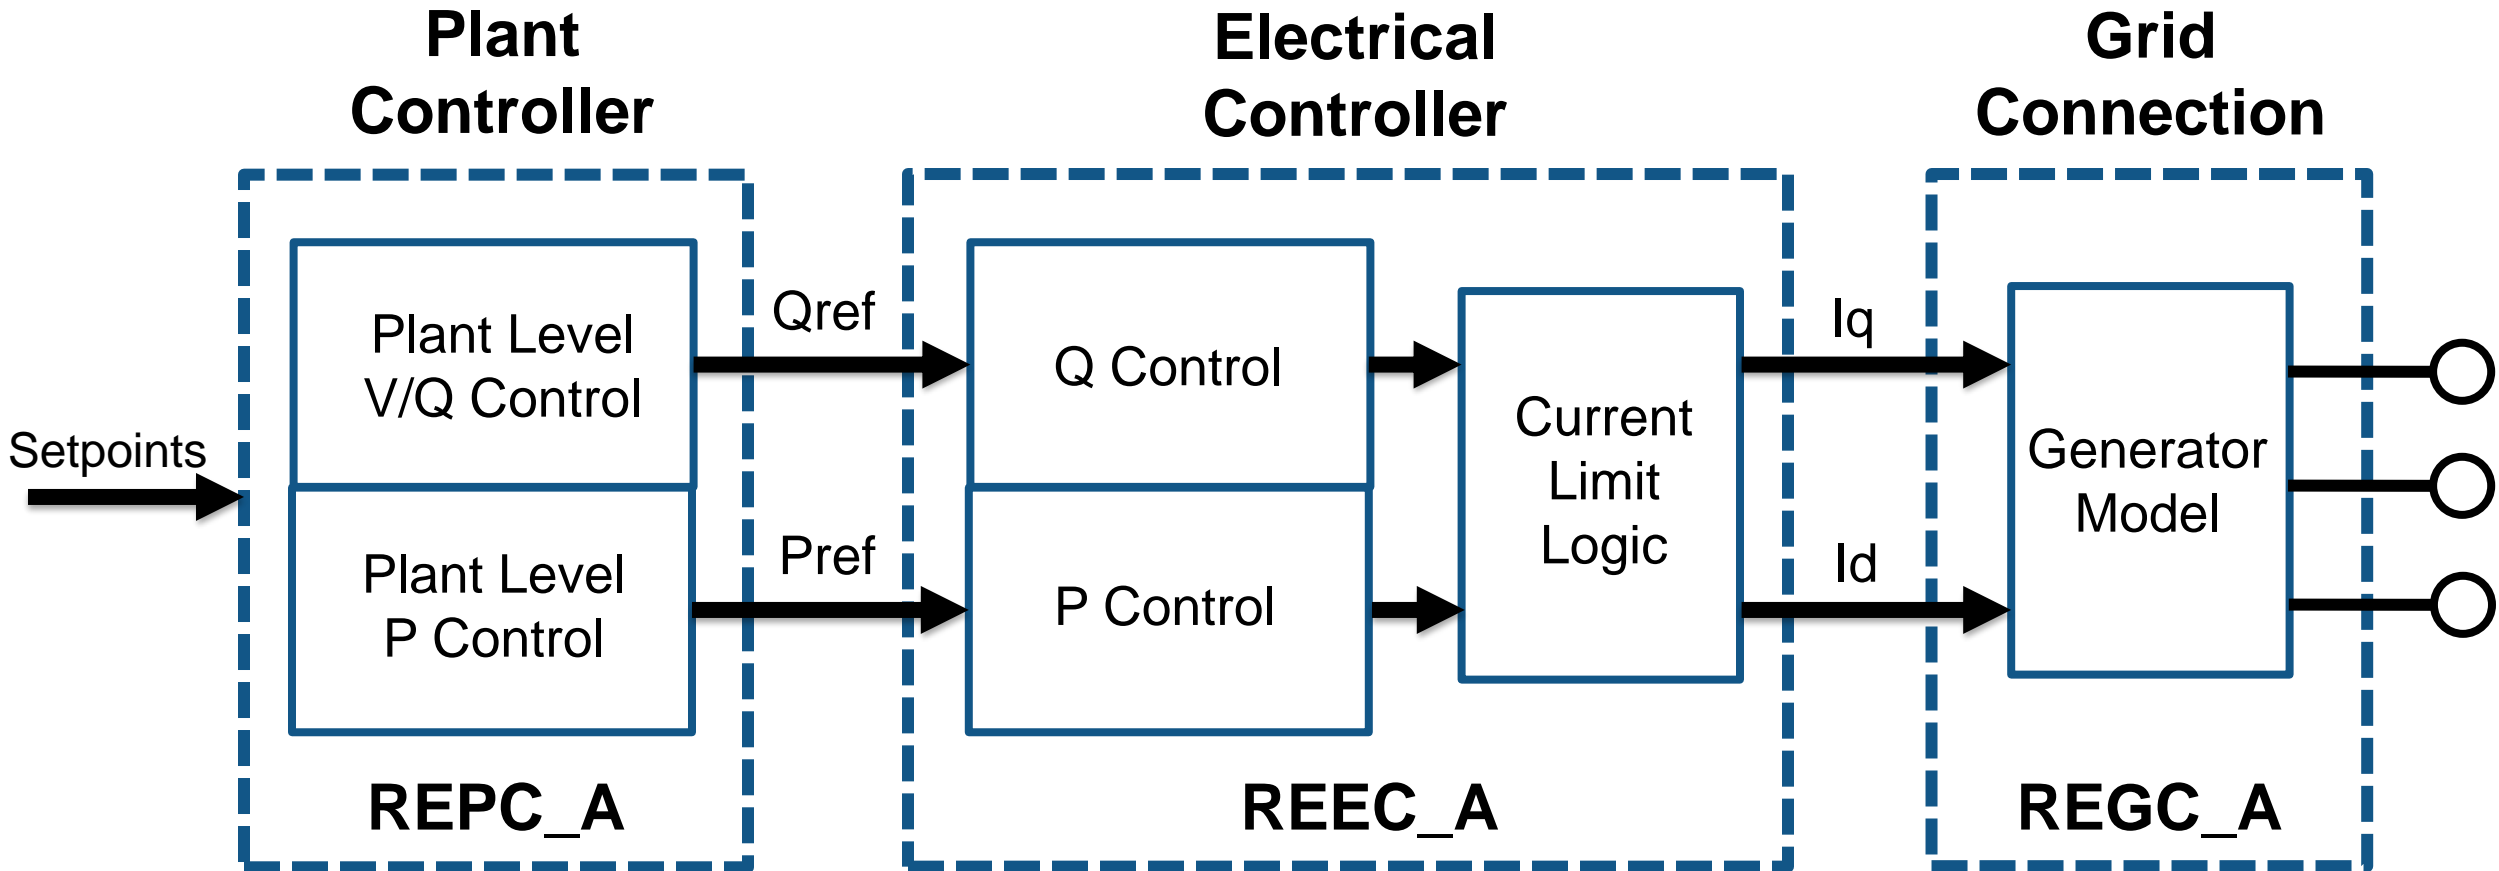

For Grid-scale System-Studies and Validation

System-Level Study

Central Station Solar Plant One-line Diagram and Controls

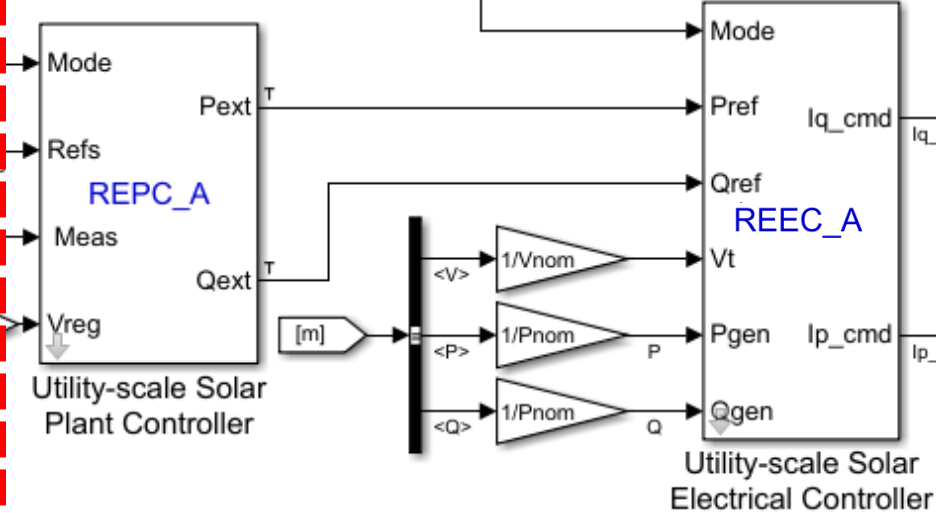

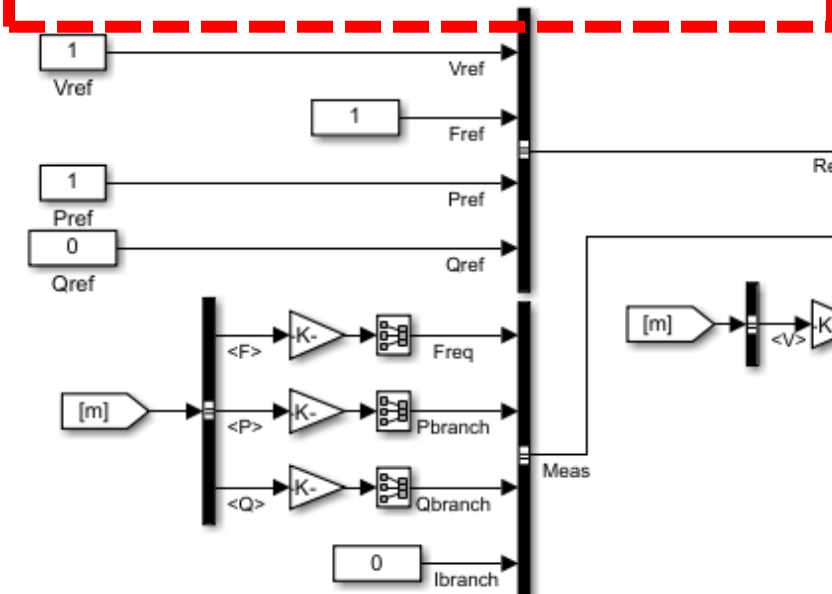

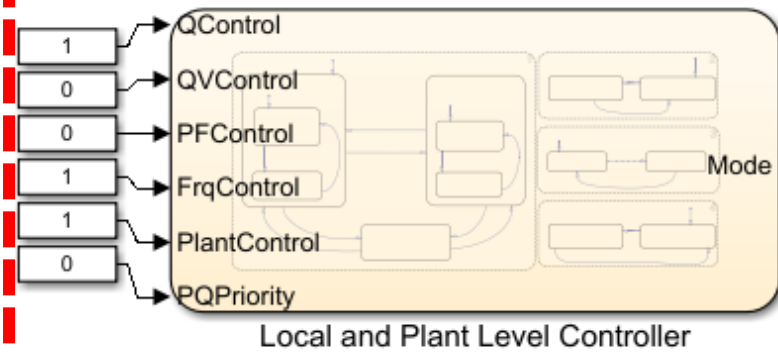

IEEE Standardized Controls for System-Studies and Validation

Central Station Solar Plant in Simscape Electrical

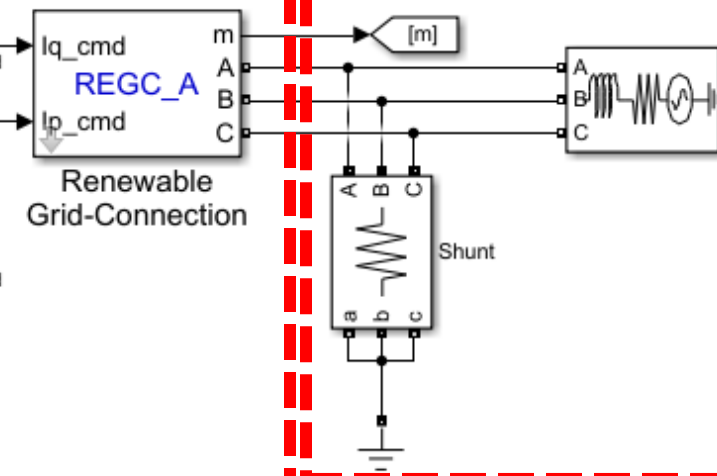

IEEE Standardized Controls for System-Studies and Validation

Plant Mode

Solar Farm Controls/Dynamics

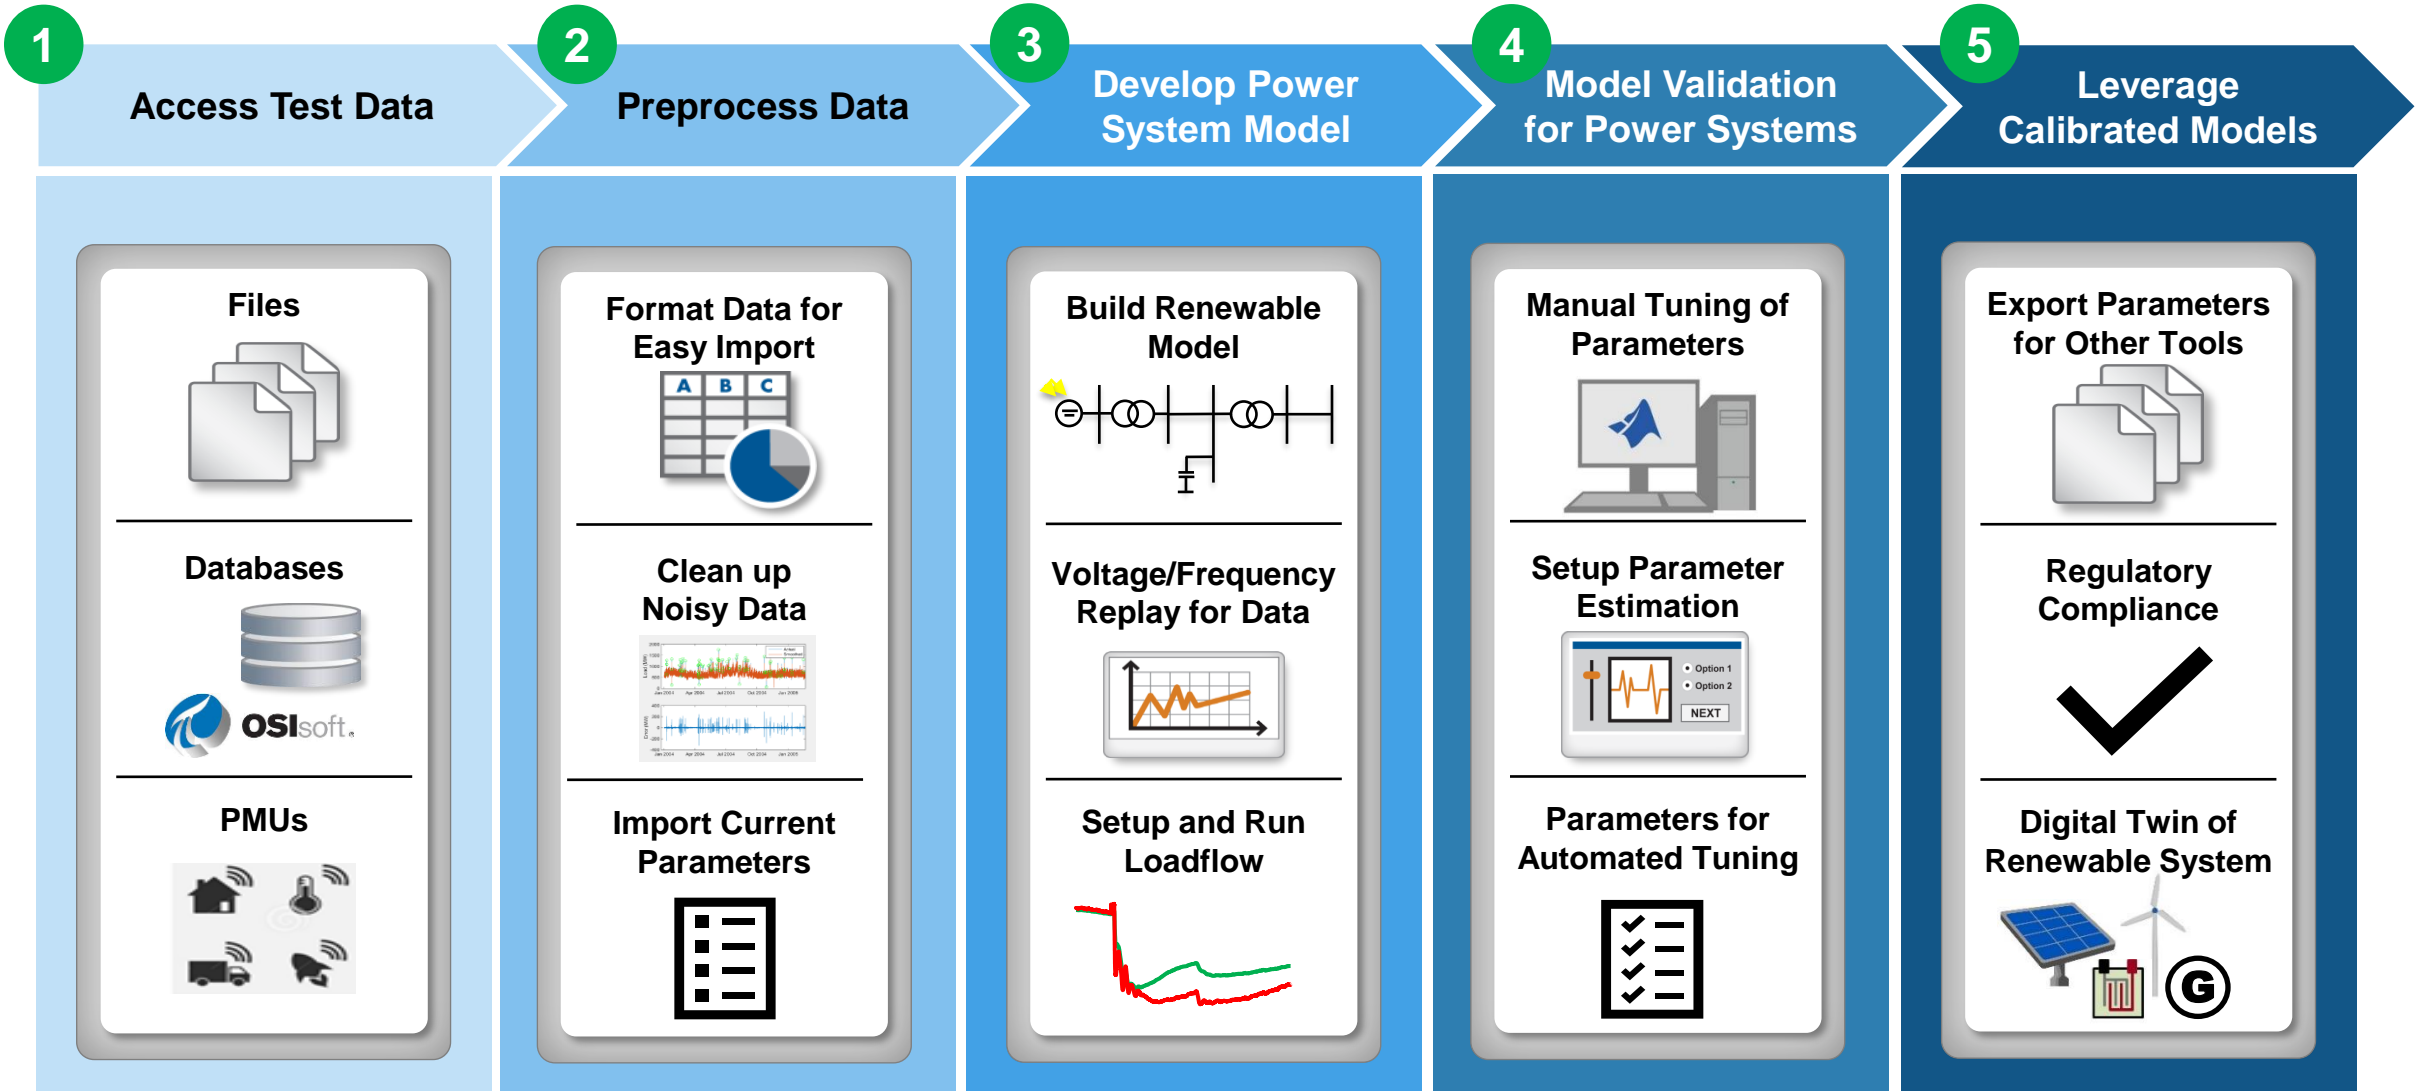

Grid PCC

Power Plant Model Validation Workflow

Parameter Estimation for Multiple Grid Tests

Power Plant Model Validation (PPMV) with MATLAB and Simulink

Download white paper

Learn how to create a workflow for power plant model validation using manual and automated techniques. This approach to PPMV is especially important when required by technical regulations such as NERC MOD-026.

Explore PPMV as applied to online performance monitoring of grid events using PMU data and a workflow that includes both manual adjustments and automated techniques.

Through a gas plant case study, you will learn how to:

1. Replay measured data through your simulations
2. Gain insight into response discrepancies through both VF and PQ replay
3. Use automated parameter sensitivity to assess and rank the influence of system parameters on system response
4. Fine-tune your system response using both manual adjustments and automated parameter estimation

Download [this white paper](#) to learn how you can efficiently perform PPMV with MATLAB® and Simulink®.
